Summary

Hypersonic flows present a unique challenges due to the complex interplay of fluid dynamics, chemical reactions, and optical phenomena. As a signal from a Light Detection and Ranging (LiDAR) travels through a hypersonic flow field, the beam would be affected by the flow.

HAOT is a Hypersonic Aerodynamics Optics Tools Python package developed to calculate the index of refraction of a hypersonic medium.

Statement of Need

Many techniques used to calculate optical properties are scatter in papers but there is not a local repo containing all this calculations, furthermore some of these calculations require the use of spectroscopy constants, which have been properly documented and added to the package.

Algorithms

The HAOT pacakge, contains five modules: - Modules: - Arodynamics - Optics - Quantum Mechanics - Constants - Conversions

Each module can be imported independed and the documentation explains in detail what each module does. Furthremore, docstrings have been added to the function and the description of each function can be seeing in an interactive python session. section shows the equation used to calculate the index of refraction. Where: ρ_s is the species density, ρ is the flow's density, and K_s is the specie's Gladstone-Dale constant.

$$n - 1 = \rho \sum_{s=1}^{N} K_s \rho_s$$

$$n - 1 = \rho \sum_{s=1}^{N} K_s \rho_s$$
